Project Title : Effective Heart Disease Prediction Using IBM Auto AI Service

Effective Heart Disease Prediction Using IBM Auto AI Service

1 INTRODUCTION

1.1 Overview

Human body is made up of various organs, all of which have their own functions. Heart is one such organ which pumps the blood through the body and if it doesn't do so, the human body can have fatal circumstances. One of the main reasons of mortality today is having heart disease. So it becomes necessary to make sure that our cardiovascular system or any other system in the human body for that matter must remain healthy. Unfortunately, people all around the world have been facing cardiovascular diseases.

Heart disease also known as cardiovascular disease (CVD). In recent times, heart disease prediction is most complicated task in medical field. In modern era, approximately one person dies per minute due to heart disease. Data science plays a crucial rule in processing huge amount of data in the field of health care. As heart disease prediction is complicate task, there is a need to automate the prediction process to avoid the risks associated with it and alert the patient well in advance.

1.2 Purpose

The main objective of the project is to develop heart disease prediction system using machine learning algorithms. The system can discover and extract hidden knowledge associated with disease from historical heart disease data set.

- Reduce the cost of medical tests
- Provides new approach to concealed patterns in data.
- Helps avoid human biasness.

- To implement different classifiers those classifies disease as per input of the user
- To evaluate and identify the best out of all algorithms.
- Lower number of deaths from heart disease.
- Provide disease status to patient before he got infected severely.

2 LITERATURE SURVEY

2.1 Existing problem

In the existing system, the input details are obtained from the patient. Then from the user inputs, using ML techniques heart disease is analyzed. Now, the obtained results are compared with the results of existing models within the same domain and found to be improved. The data of heart disease patients collected is used to discover patterns with NN, DT, Support Vector machines SVM, and Naive Bayes. The results are compared for performance and accuracy with these algorithms.

2.2 Proposed solution

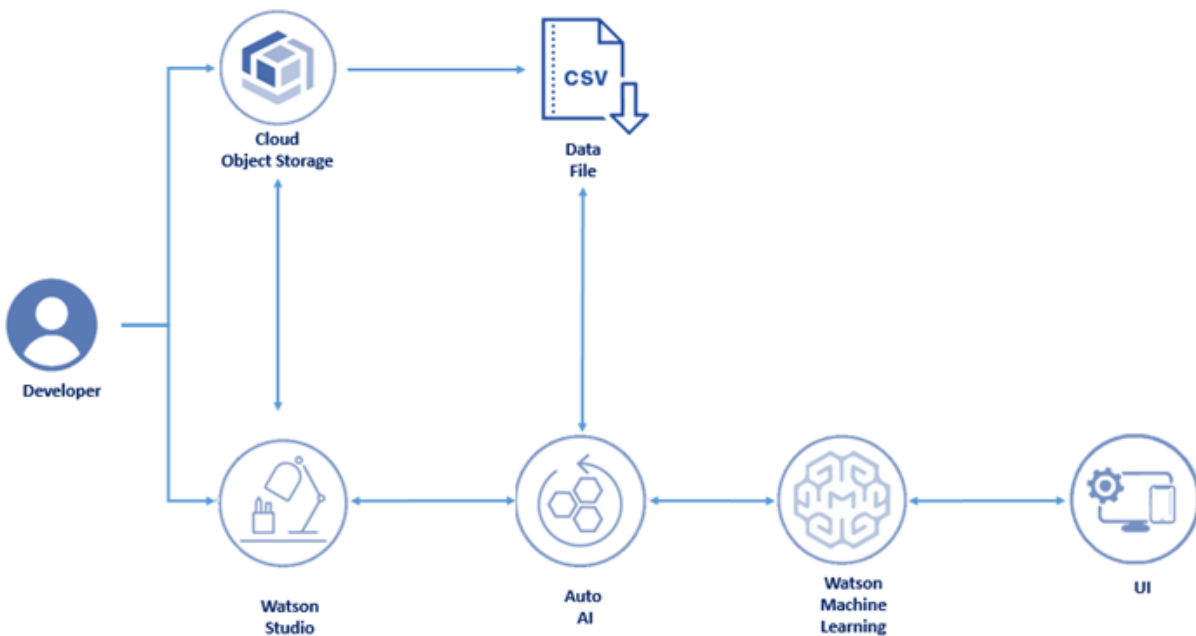

We develop an AI-based Heart detection system using machine learning techniques. We present data processing that entails working with categorical variables and conversion of categorical columns.

In our proposed system, A predictive model will be built using AutoAI on IBM Cloud Pak for Data. The model is then deployed to the Watson Machine Learning service, where it can be accessed via a REST API. A Node.js web app that allows a user to input some data to be scored against the previous model.

3 THEORITICAL ANALYSES

3.1 Block diagram

1. The developer creates a Cloud Pak for Data project.
2. A model is created with AutoAI by uploading some data.
3. Data is backed up and stored on Cloud Object Storage.
4. The model is deployed using the Watson Machine Learning service.
5. A Node.js web app is deployed on IBM Cloud. It calls the predictive model hosted on the Watson Machine Learning service.
6. A user visits the web app, enters their information, and the predictive model returns a response

3.2 Hardware / Software designing

- IBM Watson Studio
- IBM Watson Machine Learning
- Node-RED

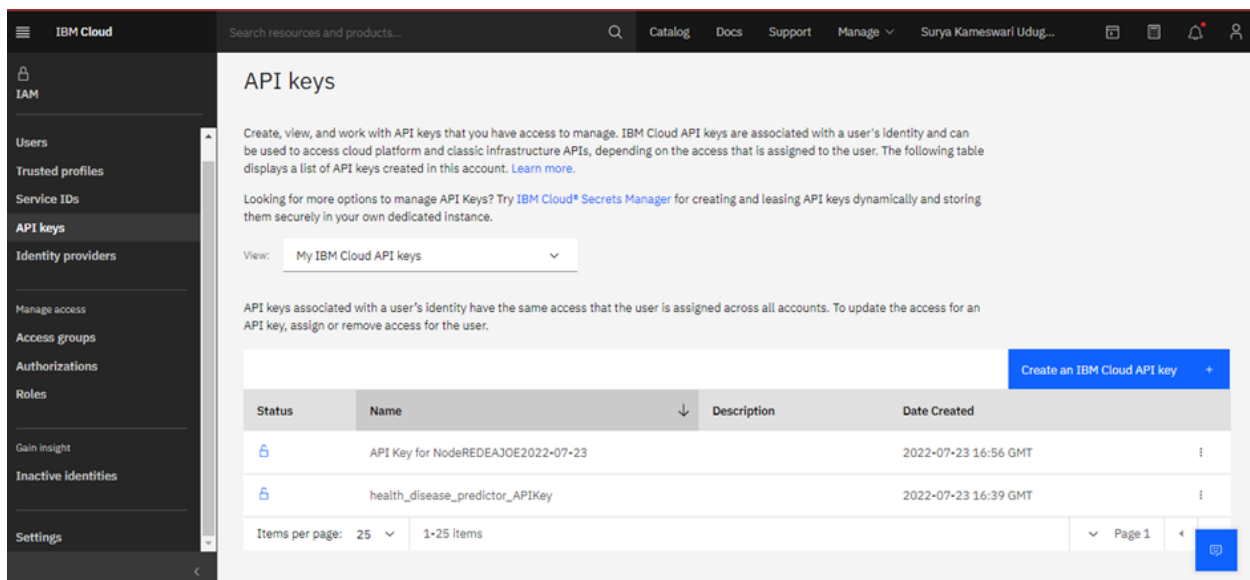

- IBM Cloud Object Storage

4 EXPERIMENTAL INVESTIGATIONS

1. Create an IBM Cloud API key

To use the Watson Machine Learning service programmatically we'll need an API key.

Navigate to <https://cloud.ibm.com/iam/apikeys> and choose to create a new API key.

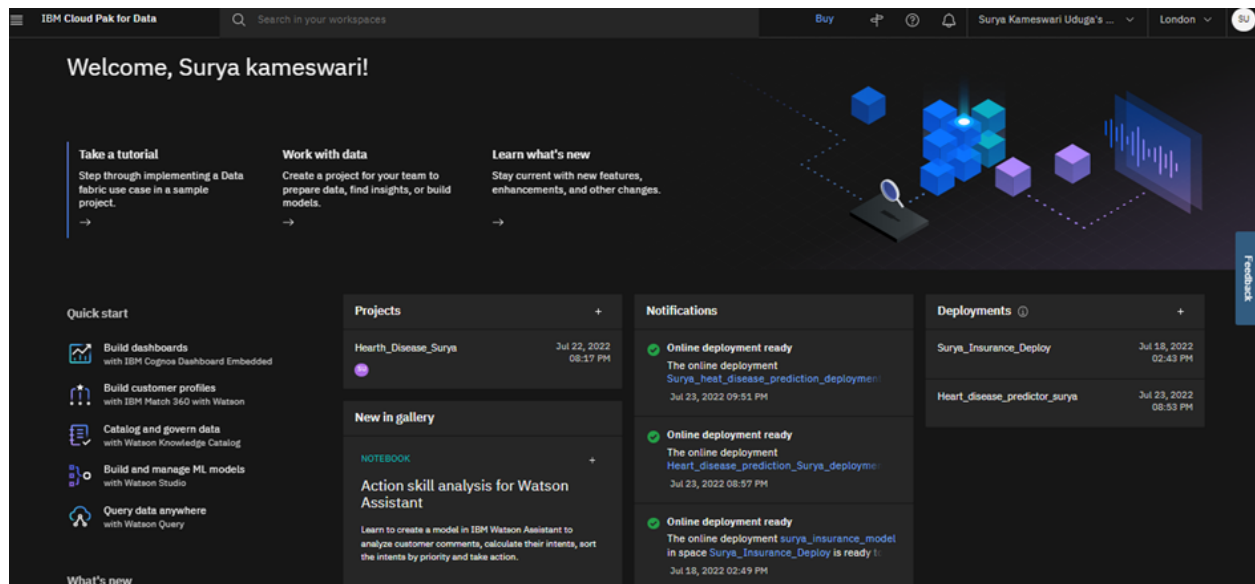

The screenshot displays the IBM Cloud IAM API keys management interface. The left sidebar contains navigation links for IAM, Users, Trusted profiles, Service IDs, API keys (selected), Identity providers, Manage access, Access groups, Authorizations, Roles, Gain insight, Inactive identities, and Settings. The main content area is titled 'API keys' and includes a search bar, a 'View' dropdown set to 'My IBM Cloud API keys', and a 'Create an IBM Cloud API key' button. Below this is a table with the following data:

Status	Name	Description	Date Created
🔓	API Key for NodeREDEAJOE2022-07-23		2022-07-23 16:56 GMT
🔓	health_disease_predictor_APIKey		2022-07-23 16:39 GMT

At the bottom of the table, there is a pagination control showing 'Items per page: 25' and '1-25 Items'.

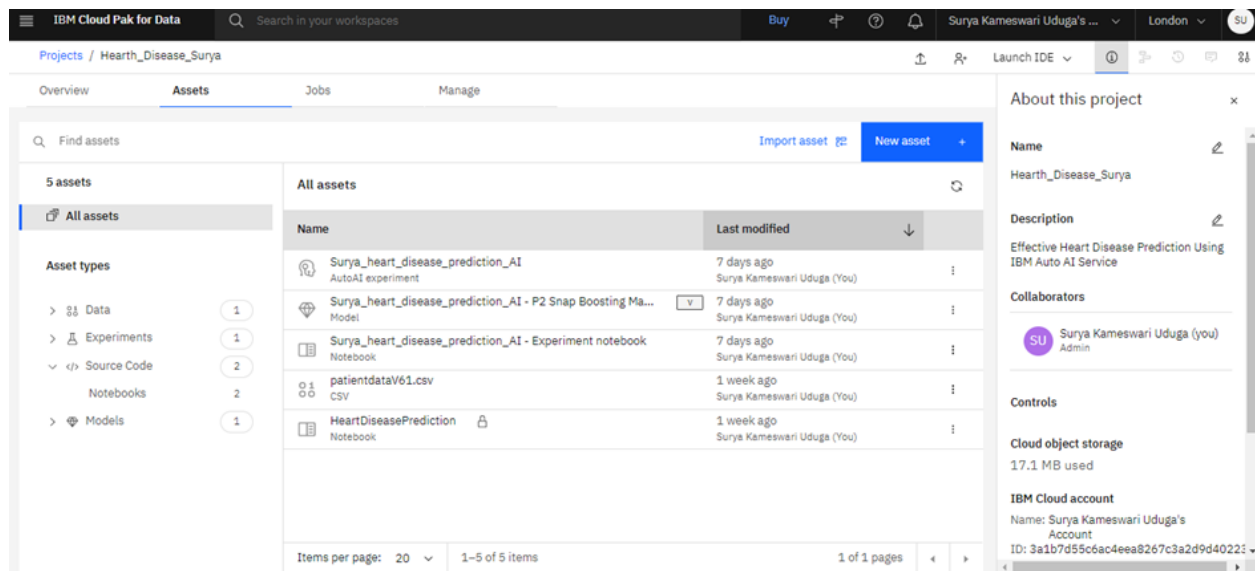

2. Create a new Cloud Pak for Data project

Log into IBM's Cloud Pak for Data service (formally known as Watson Studio). Once in, you'll land on the dashboard. Create a new project by clicking Create a project.

NOTE: By creating a project in Watson Studio a free tier Object Storage service will be created in your IBM Cloud account. Select the Free storage type to avoid fees.

At the project dashboard click on the Assets tab and upload the data set associated with this repo. *patientdataV61.csv*

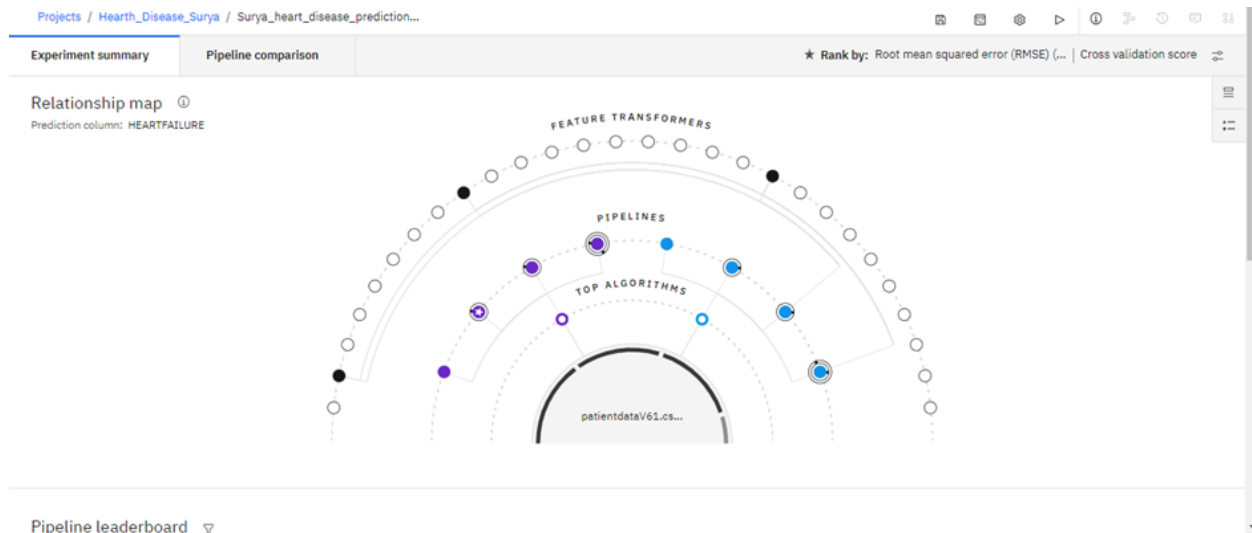

Build a model with AutoAI

Now we build a model from the data using IBM's AutoAI. A tool that will automatically create

multiple models and test them, giving us the best result.

Start by clicking on Add to project and choosing AutoAI experiment. Give it a name like Surya_heart_disease_prediction and specify a Watson Machine Learning instance.

The screenshot shows the 'Heart disease Predictor' web application. The input fields are: AVERAGE HEART BEATS (Per Minute), PALPITATIONS PER DAY *, CHOLESTEROL *, BMI *, AGE *, SEX (M or F) *, FAMILY HISTORY (Y or N) *, SMOKER (In Last 5 Years : Y or N) *, and EXERCISE (Minutes Per Week) *. There are 'SUBMIT' and 'CANCEL' buttons. The prediction result is 'At Risk' with a score of '0.8203024201393127'.

Prediction	Score
At Risk	0.8203024201393127
